

## Summary:

- **Foundation** contains all essential common class for the App.
- **DataService** contains all Network and non Network data classes and protocols.
- **Auth** is takes care of authentication.
- **UIFoundation** maintains all reusable UI code.
  
- All *yellow* coloured modules have dependency on one of the above modules.
- All Modules are configured by the App and injected into required modules.
- Each module then contains multiple Screens following MVVM architecture.
- Each Module contains a extension of 'CoreSandbox' which holds all required dependencies and shared resources.
- I have not gone into individual module details as it would be very complex and require more time.
